### DETAILED DESCRIPTION OF THE INVENTION

In the above recitations, the term "alkyl", used either alone or in compound words such as "alkylthio" or "haloalkyl" includes straight-chain or branched alkyl, such as methyl, ethyl, *n*-propyl, *i*-propyl, or the different butyl, pentyl or hexyl isomers. "Alkenyl" can

include straight-chain or branched alkenes such as 1-propenyl, 2-propenyl, and the different butenyl, pentenyl and hexenyl isomers. "Alkenyl" also includes polyenes such as 1,2-propadienyl and 2,4-hexadienyl. "Alkynyl" includes straight-chain or branched alkynes such as 1-propynyl, 2-propynyl and the different butynyl, pentynyl and hexynyl isomers.

"Alkynyl" can also include moieties comprised of multiple triple bonds such as 2,5-hexadiynyl. "Alkoxy" includes, for example, methoxy, ethoxy, *n*-propyloxy, isopropyloxy and the different butoxy, pentoxy and hexyloxy isomers. "Alkylthio" includes branched or straight-chain alkylthio moieties such as methylthio, ethylthio, and the different propylthio, butylthio, pentylthio and hexylthio isomers. "Cycloalkyl" includes, for example, cyclopropyl, cyclobutyl, cyclopentyl and cyclohexyl. "Cycloalkylamino" means the amino nitrogen atom is attached to a cycloalkyl radical and a hydrogen atom and includes groups such as cyclopropylamino, cyclobutylamino, cyclopentylamino and cyclohexylamino. "(Alkyl)cycloalkylamino" means a cycloalkylamino group where the hydrogen atom is replaced by an alkyl radical; examples include groups such as (alkyl)cyclopropylamino, (alkyl)cyclobutylamino, (alkyl)cyclopentylamino and (alkyl)cyclohexylamino. Preferably the alkyl in (alkyl)cycloalkylamino is C<sub>1</sub>-C<sub>4</sub> alkyl, while the cycloalkyl in cycloalkylamino and (alkyl)cycloalkylamino is C<sub>3</sub>-C<sub>6</sub> cycloalkyl.

The term "aryl" refers to an aromatic carbocyclic ring or ring system or a heteroaromatic ring or ring system, each ring or ring system optionally substituted. The term "aromatic ring system" denotes fully unsaturated carbocycles and heterocycles in which at least one ring of a polycyclic ring system is aromatic. Aromatic indicates that each of ring atoms is essentially in the same plane and has a *p*-orbital perpendicular to the ring plane, and in which  $(4n + 2)$   $\pi$  electrons, when *n* is 0 or a positive integer, are associated with the ring to comply with Hückel's rule. The term "aromatic carbocyclic ring system" includes fully aromatic carbocycles and carbocycles in which at least one ring of a polycyclic ring system is aromatic (e. g. phenyl and naphthyl). The term "heteroaromatic ring or ring system" includes fully aromatic heterocycles and heterocycles in which at least one ring of a polycyclic ring system is aromatic and in which at least one ring atom is not carbon and can contain 1 to 4 heteroatoms independently selected from the group consisting of nitrogen, oxygen and sulfur, provided that each heteroaromatic ring contains no more than 4 nitrogens, no more than 2 oxygens and no more than 2 sulfurs (where aromatic indicates that the Hückel rule is satisfied). The heterocyclic ring systems can be attached through any available carbon or nitrogen by replacement of hydrogen on said carbon or nitrogen. More specifically, the term "aryl" refers to the moiety

wherein  $R^2$ , X and n are defined as above and the numerals 3 through 6 indicate respectively the 3-position through the 6-position for substituents on the moiety.

The term "halogen", either alone or in compound words such as "haloalkyl", includes fluorine, chlorine, bromine or iodine. Further, when used in compound words such as "haloalkyl", said alkyl may be partially or fully substituted with halogen atoms which may be the same or different. Examples of "haloalkyl" include  $F_3C$ ,  $ClCH_2$ ,  $CF_3CH_2$  and  $CF_3CCl_2$ . The terms "haloalkenyl", "haloalkynyl", "haloalkoxy", and the like, are defined analogously to the term "haloalkyl". Examples of "haloalkenyl" include  $(Cl)_2C=CHCH_2$  and  $CF_3CH_2CH=CHCH_2$ . Examples of "haloalkynyl" include  $HC\equiv CCHCl$ ,  $CF_3C\equiv C$ ,  $CCl_3C\equiv C$  and  $FCH_2C\equiv CCH_2$ . Examples of "haloalkoxy" include  $CF_3O$ ,  $CCl_3CH_2O$ ,  $HCF_2CH_2CH_2O$  and  $CF_3CH_2O$ .

Examples of "alkylcarbonyl" include  $C(O)CH_3$ ,  $C(O)CH_2CH_2CH_3$  and  $C(O)CH(CH_3)_2$ . Examples of "alkoxycarbonyl" include  $CH_3OC(=O)$ ,  $CH_3CH_2OC(=O)$ ,  $CH_3CH_2CH_2OC(=O)$ ,  $(CH_3)_2CHOC(=O)$  and the different butoxy- or pentoxycarbonyl isomers. The terms "alkylaminocarbonyl" and "dialkylaminocarbonyl" include, for example,  $CH_3NHC(=O)$ ,  $CH_3CH_2NHC(=O)$  and  $(CH_3)_2NC(=O)$ .

The total number of carbon atoms in a substituent group is indicated by the " $C_i-C_j$ " prefix where i and j are numbers from 1 to 8. For example,  $C_1-C_3$  alkylsulfonyl designates methylsulfonyl through propylsulfonyl. In the above recitations, when a compound of Formula I contains a heteroaromatic ring, all substituents are attached to this ring through any available carbon or nitrogen by replacement of a hydrogen on said carbon or nitrogen.

When a group contains a substituent which can be hydrogen, for example  $R^1$ , then, when this substituent is taken as hydrogen, it is recognized that this is equivalent to said group being unsubstituted.

Compounds of this invention can exist as one or more stereoisomers. The various stereoisomers include enantiomers, diastereomers, atropisomers and geometric isomers. One skilled in the art will appreciate that one stereoisomer may be more active and/or may exhibit beneficial effects when enriched relative to the other stereoisomer(s) or when separated from the other stereoisomer(s). Additionally, the skilled artisan knows how to separate, enrich, and/or to selectively prepare said stereoisomers. Accordingly, the compounds of the invention may be present as a mixture of stereoisomers, individual stereoisomers, or as an optically active form.

Preferred methods of preparing compounds I, II and 6 comprise the preferred compounds above.

As shown in Scheme 1, compounds of Formula II can be prepared from compounds of Formula I by treatment with a catalytic amount of a suitable acid. The catalytic acid can be, for example, sulfuric acid. The reaction is generally conducted using an organic solvent. As one skilled in the art will realize, dehydration reactions can be conducted in a wide variety of solvents in a temperature range generally between about 0 and 200 °C, more preferably between about 0 and 100 °C. For the dehydration in the method of Scheme 1, a solvent comprising acetic acid and temperatures of about 65 °C are preferred. Compounds of Formula I wherein  $R^3$  is H are preferred for this transformation. Compounds of Formula II ( $R^6$  is  $C_1$ - $C_4$  alkyl) can be converted to compounds of Formula II ( $R^6$  is H) by numerous methods including nucleophilic cleavage under anhydrous conditions or hydrolytic methods involving the use of either acids or bases (see T. W. Greene and P. G. M. Wuts, *Protective Groups in Organic Synthesis*, 2nd ed., John Wiley & Sons, Inc., New York, 1991, pp. 224-269 for a review of methods). Base-catalyzed hydrolytic methods are preferred. Suitable bases include alkali metal (such as lithium, sodium or potassium) hydroxides. For example, the ester can be dissolved in a mixture of water and alcohol such as ethanol. Upon treatment with sodium hydroxide or potassium hydroxide, the ester is saponified to provide the sodium salt of the carboxylic acid. Acidification with a strong acid, such as hydrochloric acid or sulfuric acid, yields the carboxylic acid. The carboxylic acid can be isolated by methods known to those skilled in the art, including crystallization, extraction and distillation.

Scheme 1

As illustrated in Scheme 2, compounds of Formula I can be prepared from compounds of Formula 6 by treatment with a suitable base in a suitable organic solvent. Examples of suitable bases include (but are not limited to) sodium hydride, potassium *t*-butoxide, dimethyl sodium ( $\text{CH}_3\text{S}(\text{O})\text{CH}_2^- \text{Na}^+$ ), alkali metal (such as lithium, sodium or potassium) carbonates or hydroxides, tetraalkyl (such as methyl, ethyl or butyl)ammonium fluorides or hydroxides, or 2-*tert*-butylimino-2-diethylamino-1,3-dimethyl-perhydro-1,3,2-diazaphosphonine. Examples of suitable organic solvents include (but are not limited to) acetone, acetonitrile, tetrahydrofuran, dichloromethane, dimethylsulfoxide, and *N,N*-dimethylformamide. The cyclization reaction is usually conducted in a temperature range from about 0 to 120 °C. The effects of solvent, base, temperature and addition time are all interdependent, and choice of reaction conditions is important to minimize the formation of byproducts. A preferred base is tetrabutylammonium fluoride. The intermediate formed in the reaction, Formula Ia wherein  $\text{M}^+$  is a suitable counterion derived from the base, is then protonated by a suitable acid (for example, acetic acid) to give compounds of Formula Ib wherein  $\text{R}^3$  is H. As one skilled in the art will know, intermediates such as Ia may be alkylated or acylated by the addition of a suitable alkylating or acylating agent to give compounds of Formula Ic wherein  $\text{R}^3$  is  $\text{C}_1$ - $\text{C}_4$  alkyl,  $\text{C}_2$ - $\text{C}_4$  alkylcarbonyl or  $\text{C}_2$ - $\text{C}_6$  alkoxy carbonyl. Alternatively, compounds of Formula Ic can be prepared from compounds of Formula Ib in a separate chemical step using a suitable base and alkylating or acylating agent. Suitable alkylating agents include  $\text{C}_1$ - $\text{C}_4$  alkyl halides, sulfates and sulfonates; suitable acylating agents include acid chlorides or anhydrides and chloroformates. In any case, when using Ia or Ib, an alkylating or acylating agent suitable for substituting an  $\text{R}^3$  for an alkoxide counterion is used.

### Scheme 2

Compounds of Formula 6 can be prepared by treatment of compounds of Formula 4 with compounds of Formula 5 in a suitable organic solvent in the presence of an acid scavenger such as triethylamine. Examples of suitable organic solvents include (but are not limited to) dichloromethane and tetrahydrofuran. The reaction is usually conducted at a temperature between about 0 and 100 °C. Scheme 3 illustrates this transformation.

### Scheme 3

As illustrated by Scheme 4, the hydrazone compound of Formula 4 can be prepared from hydrazine compound of Formula 2 by treatment with a compound of Formula 3 in a solvent such as water, methanol or acetic acid. One skilled in the art will recognize that this reaction may require catalysis by an optional acid and may also require elevated temperatures depending on the molecular substitution pattern of the hydrazone of Formula 4.

### Utility

The compounds of Formulae I, II, 4 and 6 are useful as synthetic intermediates for preparing a compound of Formula III

III

- 5 wherein X,  $R^1$ ,  $R^2$  and n are defined as above;  $R^7$  is  $CH_3$ , Cl or Br;  $R^8$  is F, Cl, Br, I or  $CF_3$ ; and  $R^9$  is  $C_1-C_4$  alkyl.

Compounds of Formula III are useful as insecticides.

Compounds of Formula III can be prepared from compounds of Formula II (and in turn from compounds of Formula 4, 6 and I) by the processes outlined in Schemes 5-7.

- 10 Coupling of a pyrazolecarboxylic acid of Formula IIa (a compound of Formula II wherein  $R^6$  is H) with an anthranilic acid of Formula 7 provides a benzoxazinone of Formula 8. In Scheme 5, a benzoxazinone of Formula 8 is prepared directly via sequential addition of

methanesulfonyl chloride in the presence of a tertiary amine such as triethylamine or pyridine to a pyrazolecarboxylic acid of Formula IIa, followed by the addition of an anthranilic acid of Formula 7, followed by a second addition of tertiary amine and methanesulfonyl chloride. This procedure generally affords good yields of the benzoxazinone.

Scheme 5

Scheme 6 depicts an alternate preparation of benzoxazinones of Formula 8 involving coupling of a pyrazole acid chloride of Formula 10 with an isatoic anhydride of Formula 9 to provide the Formula 8 benzoxazinone directly.

Scheme 6

Solvents such as pyridine or pyridine/acetonitrile are suitable for this reaction. The acid chlorides of Formula 10 are available from the corresponding acids of Formula IIa by known procedures such as chlorination with thionyl chloride or oxalyl chloride.

Compounds of Formula III can be prepared by the reaction of benzoxazinones of Formula 8 with  $\text{C}_1\text{--C}_4$  alkyl amines as outlined in Scheme 7. The reaction can be run neat or in a variety of suitable solvents including tetrahydrofuran, diethyl ether, dichloromethane or chloroform with optimum temperatures ranging from room temperature to the reflux temperature of the solvent. The general reaction of benzoxazinones with amines to produce anthranilamides is well documented in the chemical literature. For a review of

benzoxazinone chemistry see Jakobsen et al., *Biorganic and Medicinal Chemistry* **2000**, *8*, 2095–2103 and references cited within. See also Coppola, *J. Heterocyclic Chemistry* **1999**, *36*, 563–588.

Of note are methods of preparing compounds of Formula III wherein n is 0.

Also of note are methods of preparing compounds of Formula III wherein n is from 1 to 3.

1. ☐ Claims Nos.:  
because they relate to subject matter not required to be searched by this Authority, namely:
2. ☐ Claims Nos.:  
because they relate to parts of the International Application that do not comply with the prescribed requirements to such an extent that no meaningful International Search can be carried out, specifically:
3. ☐ Claims Nos.:  
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

## Box II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

see additional sheet

1. ☐ As all required additional search fees were timely paid by the applicant, this International Search Report covers all searchable claims.
2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3. ☐ As only some of the required additional search fees were timely paid by the applicant, this International Search Report covers only those claims for which fees were paid, specifically claims Nos.:
4. ☒ No required additional search fees were timely paid by the applicant. Consequently, this International Search Report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

1-31

Remark on Protest

- ☐ The additional search fees were accompanied by the applicant's protest.
- ☐ No protest accompanied the payment of additional search fees.
